The invention relates to a double-stranded short interfering nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (sINA) molecule that down-regulates expression of an endogenous mammalian target gene comprising one or more chemical modifications and each strand of the double-stranded sinA comprises about 21 nucleotides. The sinA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary diseases such as restenosis, atherosclerosis, Albreimer's disease, Parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclarosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA DNA-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New double-stranded short interfering nucleic acid molecule, useful for down-regulating the expression of an endogenous mammalian target gene or for treating diseases that respond to modulation of gene expression or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the invention demonstrates antiarteriosclerotic, neuroprotective, nootropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition
                                                                                                                                                                                                                                                double-stranded short interfering nucleic acid; siNA; antiarteriosclerotic; neuroprotective; nootropic; antiparkinsonian; anticonvulsant; pulmonary disease; restenosis; atherosclerosis; Alzheimer's; Parkinson's; epilepsy; dementia; huntington's; amyotrophic lateral sclerosis; gene therapy; ss; DNA-RNA hybrid; CDK2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 21 BP; 5 A; 4 C; 4 G; 2 T; 6 U; 0 Other;

The invention relates to a double-stranded short interfering nucleic acid (siNA) molecule that down-regulates expression of an endogenous mammalian target gene comprising one or more chemical modifications and each strand of the double-stranded siNA comprises about 21 nucleotides. The siNA of nootropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New double-stranded short interfering nucleic acid molecule, useful for down-regulating the expression of an endogenous mammalian target gene or for treating diseases that respond to modulation of gene expression or activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diseases such as restenosis, atherosclerosis, Alzheimer's disease, Parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA DNA-

Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic retinopathy and cancer.

Disclosure; SEQ ID NO 379; 218pp; English.

This invention relates to novel compositions that comprise short interfering RNA (siRNA) molecules, which can be used to inhibit or angiogenesis. Specifically, it refers to siRNAs that target and cause RNA-induced degradation of mRNA from human vascular endothelial growth factor (VEGF), the VEGF receptor (FIL-1) and the FIR-1/KDR (kinase domain cegion) genes, as well as mutants derived thereof. The present invention describes sense and antisense RNA strands that form an RNA duplex and bind to the target mRNA, such that expression is inhibited and the target of bind to the target mRNA, such that expression is inhibited and the target search, siRNA administered in combination with a therapeutic agent is useful for treating diseases associated with angiogenesis and related macular degeneration, inflammatory disease, psoriasis and the overexpression of VEGF, which include diabetic retinopathy, agenthemmatoid archritis. Furthermore, it can be used to treat various cancers including breast, retinoblastoma, Wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antidiammatory, antipsoriatic, antidiabetic antiarthritic activities. This oligonucleotide is a human FIt-1 DNA very

The invention relates to a method of designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase comparises: (a) aligning a first primer and a second primer; The method comprises: (a) aligning a first primer and a second primer; and (b) selecting the first primer and a second primer; and (b) contain four or more bases that are perfectly matching to the 3' end cosn not contain four or a second primer, the first primer at its 3' end does not contain seven or more bases that are perfectly matching cexcept one mismatch to the 3' end sequence of the first primer at its 3' end does not contain six or more bases that are perfectly matching to second primer, the first primer at its 3' end does not contain six or more bases that are perfectly matching to a sequence anywhere of the first primer or the second primer, and the first primer at its 3' end does not contain eleven or more bases that are perfectly matching to one mismatch to a sequence anywhere of the first primer or the second contain eleven or more bases that are perfectly matching contain eleven or more bases that are perfectly matching contain eleven or more bases that are perfectly matching contain eleven or more bases that are perfectly matching contain eleven or more bases that are perfectly matching contain eleven or more bases that are perfectly matching end contain eleven or more bases that are perfectly matching end contain eleven or more bases that are perfectly matching end contain eleven or the second contain reaction. It is also useful in the identification of genetic chain reaction, the studies in pharmacogenetic reactions, the genotyping technologies. This sequence corresponds to an example of a primer of the invention.

transcribed by the sequence represented in AAT02479. This sequence is a transcribed by the sequence represented in AAT02479. This sequence is a sense primer corresponding to a region of domain D of the retinoid X receptor (RXR) beta gene and was used as a control. The DNA was obtained from transgent mice that had a mutation in the RXR alpha gene. RXR is a from transgent mice that had a mutation in the RXR alpha gene. RXR is member of the steroid/thyroid receptor superfamily. By mutating the DNA binding domain sequence in one of the steroid/thyroid receptors (e.g. the binding domain sequence) of a mouse, a transgenic mouse expressing less than retinoid X receptor) of a mouse, a transgenic mouse expressing less than cations and the role of members of the steroid/thyroid receptor can determining the role of members of the steroid/thyroid receptor can superfamily in development and physiology. RXR-alpha-deficient mice created in this manner allow for molecular dissection of ventricular chamber development. The mice are also useful for determining the can be used for treating cardiac hypertrophy,
                                                                                                                                                                                                                                                                               Steroid/thyroid receptor superfamily; DNA-binding domain; transgenesis; retinoid X receptor; transgenic mouse; development; physiology; therapy; RXR-alpha-deficient; ventricular chamber development; ischaemia; RXR; cardiac hypertrophy; polymerase chain reaction; primer; amplify; PCR; reverse transcriptase; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transgenic mice expressing low levels of steroid-thyroid receptors - useful for study of role of steroid-thyroid receptors in embryogenesis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.8%; Score 14.8; DB 1; Length 22;

cused in the chimeric non-human animal of the invention. The chimeric non-human animal of the invention. The chimeric non-human animal of the invention. The chimeric non-human animal of the invention, preferably a mouse, contains a foreign chromosome(s) or chromosome fragment. The animal is produced by obtaining chromosome(s) or chromosome fragment. The animal is produced by obtaining containing the lateral paying the ability to form microcells. The microcells are contained the ability to form microcells. The microcells are crown containing the foreign chromosome with calls having differentiative pluripotency and containing the foreign crownsome. These cells are then introduced into an embryo, which is then contained and brought to term. The foreign chromosome segment is at least implanted and brought to term. The foreign chromosome segment is at least chromosome segment could also contain genes associated with human chromosome segment could also contain genes associated with human contains a tree in the expression of foreign genes (especially human genes) in a non-human animal is useful for efficient production of proteins, especially corpuss the foreign genetic material can be isolated and fused with my my contain genes (especially contains animal subside contain are calls of the chimeric animal which corpus contains are supported and fused with my contains calls to produce hybridomas capable of expressing the foreign centering contains capable of expressing the foreign

This invention relates to novel oligonucleotide PCR primers which may be used to identify markers associated with genetic diseases and traits in phose, in particular to diagnose genetic diseases that are not phenotypically visible and to identify carriers of recessive diseases. A specific application is diagnosis of copper toxicosis (CT). The invention can also be used to create a genetic map of the canine genome; to generate breed-specific profiles, to establish patternity and to identify dogs from DNA fingerprints. The method provides rapid analysis of the target sequences from only a small sample of DNA. Diagnosis can be done at any time in the dog's life. The present sequence is that of a PCR
                                                                                                                                                                                                                                                                                              New oligonucleotide primers for diagnosis of genetic diseases and traits in dogs - amplify specific regions of the genome containing microsatellite repeats, especially for diagnosing copper toxicosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pluripotent cell; intrinsic gene; chimeric non-human animal; construction; human; antibiotic gene; cancer cell; embryonic; PCR primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to novel oligonuclectide PCR primers which may be used to identify markers associated with genetic diseases and traits in dogs, in particular to disgnose genetic diseases that are not phenotypically visible and to identify carriers of recessive diseases. A specific application is diagnosis of copper toxicosis (CT). The invention generate bread-specific profiles, to establish paternity and to identify dogs from DNA fingerprints. The method provides rapid analysis of the at any time in the dog's life. The present sequence is that of a PCR prime in the dog's life. The present sequence is that of a PCR

The invention relates to a novel method of producing cells containing a modified foreign chromosome or chromosome fragment. The method comprises:

(a) fusing a microcell comprising the foreign chromosome or chromosome fragment, with a cell having a high efficiency for homologous recombination; (b) marking the desired site of insertion of the foreign chromosome using a targeting vector; and (c) inducing deletion or translocation at the marked site. Transgenic animals produced by the method are useful to provide disease models and knockout animals, and in the production of human proteins, particularly human antibodies. This sequence is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Foreign chromosome; microcell fusion; homologous recombination; antibody; targeting vector; transgenic animal; disease model; knockout animal;
                                                                                  The invention relates to a novel method of producing cells containing a modified foreign chromosome or chromosome fragment. The method comprises:

                                                                                                                                                                                                                    The present invention describes a method of obtaining pluripotent cells containing foreign chromosomes or their fragments (preferably at least containing foreign chromosomes or their fragments (preferably at least cf)0 kb in length, especially more than 1000 kb) by preparing cancerous cells containing the foreign chromosomes or fragments, then fusing these with pluripotent cells such as embryonic stem cells, embryonic cancer cells or their mutants. Also described are: (1) a method of obtaining hybridoma cells by fusing a cell with a high ability to produce hybridoma cells (such as mouse A9 cells) with a cell containing the foreign chromosomes or fragments (such as mice) which can express the foreign chromosomes or fragments to produce chimeric and transgenic non-human animals (especially mammals such as mice) which can express the foreign chromosomes or fragments or introduced; and (3) chimeric animals, their offspring an ethod as in (2). The cells derived from the offspring production of monoclonal antibodies for medical use which are of human type and therefore not antigenic in chumans. They can also be used in the production of chimeric and contained by the spress useful foreign proteins, or which can express useful foreign proteins, or which can serve as models for the study of human diseases. AAV52755 to AAV52828 are containing the samples from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Foreign chromosome; microcell fusion; homologous recombination; antibody; targeting vector; transgenic animal; disease model; knockout animal; PCR primer; human; ss.

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primers, and the sequences of regions flanking stress primer extension (SNPB) primers, and the sequences of regions flanking stress of single nucleotide polymorphisms SNPS. The present invention includes Kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPB primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by electroming a single-nucleotide primer extension reaction. The cligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. of agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesteroleamia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial diseases, including, rheumatoid arthritis, multiple sclerosis, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of human chromosomes 14 and 22. The chimeric mouse carries the complete human antibody heavy chain gene from chromosome 14 and the light chain lambda gene from chromosome 22. The present sequence is a PCR primer, which was used in an example from the present invention

Novel isolated polypeptide, designated NOVX, useful for treating opreventing cancer, diabetes, obesity, dyslipidemia, anorexia, and metabolic, neurodegenerative, immune and hematopoietic disorders.

Example 2; Page 372; 421pp; English.

The invention relates to an isolated polypeptide, designated NOVX, comprising a sequence fully defined in the specification. The isolated protein, its encoding polynucleotide or an antibody created from the protein, its encoding polynucleotide or an antibody created from the protein is useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder in a subject, preferably human. The isolated protein, its encoding polynucleotide or an antibody created from the protein are also useful for treating or preventing metabolic disorders, diabetes, obesity, infectious disease, an onexia, neurodegenerative, haematopoletic disorders, and various dyslipidaemias, metabolic disturbances associated with obesity, the metabolic syndrome X, wasting disorders associated with obesity, the metabolic syndrome X, wasting disorders associated with obesity, the metabolic syndrome X, wasting disorders associated with chronic diseases, and cancer. The isolated protein, its encoding chronic diseases, and cancer. The isolated protein, its encoding colving or preventing metabolic syndrome X, wasting disorders associated with an antial disorders including mood, anxiety, schizophrenic disorders, metal disorders including mood, anxiety, schizophrenic disorders, disorders of vesicular transport such as cystic fibrosis, diabetes colities, other conditions associated with abnormal vesicle trafficking including AlDS, allergic reactions, multiple sclerosis and rheumatoid arthritis. A cell comprising the vector of the invention is useful for producing non-human transgenic animals. The polynucleotide of the invention can be used to treat disorders by gene therapy. This polynucleotide sequence represents a reverse PCR primer for the polynucleotide sequence represents a reverse PCR primer for the amplification of a sequence relating to the NOVX proteins of the

                                                                                                                  or
                                                                              The present invention relates to novel human NOVX proteins, where X is any number from 1 to 91 and their coding sequences (see ADH48717-ADH48930). The proteins and coding sequences are useful for preventing creating disorders or syndromes e.g. atherosclerosis, hypertension, obesity or cancer. The present sequence was used in an example from the invention.

agents. The sequences are useful for treating metabolic disorders, cardiomyopathy, diabetes, hypertension, congenital heart defects, acrtic stenosis, atrial septal defect (ASD), atrioventricular canal defect, ductus arteriosus, pulmonary stenosis, subaortic stenosis, ventricular septal defect (VSD), valve diseases, tuberous sclerosis, sclerodera, atherosclerosis, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzbeimer's disease, Parkinson's disease, immune disorders, haematopoletic disorders, haematopoletic disorders, haematopoletic disorders, haematopoletic disorders haematopoletic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Burgess CE, Gerlach V; er RJ, Casman SJ, Ji W;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human polypeptides, termed NOVX, and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for diagnosing disease, and screening for potential therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated NOVX polypeptide useful for treating atherosclerosis, metabolic disorders, diabetes, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, NOV, gene therapy, endocrine related disease, diabetes, metabolism-related disease, obesity, central nervous system disorder;

New cytoplasmic, nuclear membrane bound or secreted polypeptides (NOVX) and polynucleotides, useful in gene therapy, e.g. for treating or preventing obesity, multiple sclerosis, allergy, cancers, hemophilia, stroke or infections.

Example 92; Page 465; 586pp; English.

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polymeptide is useful for treating endocrine/ metabolism-related diseases (e.g. obssity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, cepilepsy, multiple sclerosis, schizophrenia or depression), autoimmune and inflammatory bowel disease, theumatoid arthritis or asthma, inflammatory bowel disease, theumatoid arthritis or osteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, concers, or melanoma), liver diseases (e.g. liver cirrhosis), lung diseases (emphysema or obstructive pulmonary disease), chese are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications, and for monitoring the effects of drugs during clinical critils, this sequence represents a primer used to isolate DNA encoding novel human NOV proteins

In vitro diagnosing a condition due to inappropriate fibrosis or scarring, e.g. Dupuytren's disease by detecting polymorphism or mutation in the 16sRNA region, ND2 gene, cytochrome b region or COI gene of the mitochondrial genome.

Example 1; SEQ ID NO 36; 81pp; English.

detection of a predisposition to a condition characterised by inappropriate fibrosis or scarring comprising examining the 16sRuh inappropriate fibrosis or scarring comprising examining the 16sRuh region, ND2 gene of NADH—quinone oxidoreductase (complex I), cytochrome b (complex III) region or COI gene of Cytochrome c oxidase (complex IV) region of the mitochondrial genome to detect the presence of a genetic polymorphism or mutation linked to the development of the condition. The invention may be useful for the development of compositions with an antiinflammatory, vulnerary, dermatological or nephrotic activity. In addition, the sequences disclosed may prove useful for gene therapy. The method, kit or delivery may be useful for diagnosing or detecting or treating a predisposition to a condition characterised by inappropriate fibrosis or scarring. A modulator of mitochondrial genome gene products This invention relates to a novel method of in vitro diagnosis or

```
is useful in the manufacture of medicament for treating a condition characterised by fibrosis or scarring. The condition is Dupuytren's disease, Keloid or hypertropic scar, scleroderima, systemic sclerosis, crest syndrome, tuberous sclerosis with skin patches, familial cutaneous collagenoma, metabolic disorders of the skin, eosinophilic fascitis, collagens, darqued skin fibrosis, mixed connective tissue disorder sylver fibrosis, central and environmental exposures, pulmonary/cardiac fibrosis, liver fibrosis, cand environmental exposures, pulmonary/cardiac fibrosis, and mean environmental exposures, granderd system candidate system fibrosis, glomerulonephritis, cystic fibrosis, scleroderma, myocardial fibrosis, fibrosis following myocardial infarction and central nervous system fibrosis following a stroke or neurodegenerative disorders. The present sequence is that of a PCR primer which was used for amplification of the human mitochondrial genome in the exemplification of

                                                                                                                                                                                                                              ss; PCR; vernalisation independence polypeptide; VIP4; flowering regulation; flowering induction; cold response; vernalisation; transgenic plant; thale cress; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acids encoding vernalization independence genes, useful for regulating flowering, e.g. induction of flowering in response to cold or vernalization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated vernalisation independence polypeptide (VIP) operably linked to a promoter. The nucleic acids and the VIP polypeptides are useful for regulating flowering, particularly the induction of flowering in response to cold, or vernalisation. It can also be used to remove requirements for vernalisation in transgenic and to isolate homologous genes in other plants for similar use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a thale cress vernalisation independence polypeptide, VIP4, probe PCR primer.

neurodevelopmental diseases such as Rett syndrome, autism, non-syndromic mental retardation, idiopathic neonatal encephalopathy, idiopathic infantile spasms, idiopathic cerebral palsy, Angelman syndrome and schizophrenia. The present sequence represents a human methyl-CpG-binding protein 2, MECP2, PCR primer.
                                                                                                                                                                                                                                                                                                                                                   Screening human for Rett syndrome comprises detecting mutation in nucleic acid sequence encoding methyl-CpG-binding protein 2 (MECP2).
                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of screening a human for Rett syndrome comprising detecting a mutation in a nucleic acid sequence encoding methyl-CpG-binding protein 2 (MECP2). The method is useful for screening a human for Rett syndrome. The method is useful for screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neurodevelopmental disease; autism; non-syndromic mental retardation; idiopathic infantile spasm; idiopathic infantile spasm; adiopathic cerebral palsy; Angelman syndrome; schizophrenia; ss; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defined primer sets, useful for subtyping or typing of HLA Class I alleles.
                                                                                                                                                                                     The invention relates to a method of screening a human for Rett syndrome comprising detecting a mutation in a nucleic acid sequence encoding methyl-CpG-binding protein 2 (MECP2). The method is useful for screening a human for Rett syndrome. The method is useful for screening neurodevelopmental diseases such as Rett syndrome, autism, non-syndromic mental retardation, idiopathic neonatal encephalopathy, idiopathic infantile spasms, idiopathic cerebral palsy, Angelman syndrome and schizophrenia. The present sequence represents a human methyl-CpG-binding protein 2, MECP2, PCR primer.
                                                                                                               Screening human for Rett syndrome comprises detecting mutation in nucleic acid sequence encoding methyl-CpG-binding protein 2\ (\text{MECP2}).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. Production of the full length CFTR protein in bacterial systems has been hampered by a region in exon 6 which is homologous to the -35 and -10 boxes of prokaryotic transcription systems, and may lead to incorrect transcription and translating in a truncated CFTR protein which may be toxic to bacteria. The method of the invention comprises site-directed mutagenesis of this region of exon 6 to remove homology with the prokaryotic transcriptional start signals without affecting the encoded amino acids of the reading frame. Primers AAX04445-X04448 were used for the site-directed mutagenesis of exon 6
 for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method
                                                                                                                                                                                                                                                                                                                                                                                       Human, cystic fibrosis transmembrane conductance regulator; CFTR; PCR; recombinant; expression; bacterium; homology; Pribnow box; TATA box; transcription; translation; truncation; site-directed mutagenesis; prokaryote; open reading frame; primer; amplification; ss.

The sequences given in AAQ36670-78 are primers which were used in the isolation and cloning of the polyphenol oxidase (PPO) enzyme genes from various plants. The PPO genes were isolated, and recombinant plasmids for transformation of plant cells were produced by PCR using these primers. PPO is thought to be the predominant catalyst in browning of fruit caused by injury or damage. PPO is localised in the plastids of fault cells whereas the phenolic substrates of the enzyme are stored in the plant cells whereas the phenolic substrates of the enzyme browning reation from couring unless the plant cells are damaged and the enzyme and the substrate are mixed. The PPO gene sequences could be used to construct synthetic genes which may be used to transform plants to decrease expression of the enzyme gene. In some instances, eg. coffee, tea, black oilves etc., it is desirable to increase the level of PPO to produce colives etc., it is desirable to increase the level of PPO to produce colives etc., it is desirable to increase the level of PPO to produce colives etc., it is desirable to increase the level of PPO to produce colives for an additional 103 amino acids upstream of the N-terminum of the mature protein. This region has the properties of a chloroplast transit peptide and is most likely responsible for targetting coff the protein to be imported into the chloroplast and processed to consult in accumulation of plants with this gene may therefore could in accumulation of active grapevine PPO in other species and result in accumulation of active grapevine PPO in other companies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAQ45198-200 and AAQ61687-777 are primers which were used in the isolation and amplification of the genomic sequence of the hepatitis E virus (HEV) strain SAR-55. These primers were based on sequences derived from the SAR-55 strain and a strain from Burma (BUR-121). The amplified sequence contains three open reading frames (ORFs). The proteins encoded by this sequence can be used to stimulate the production of protective antibodies upon injection into a mammal that would serve to protect the mammal upon challenge with wild type HEV. The proteins can be used for detection and diagnosis of HEV infection. This cDNA was isolated from primates innoculated with stool suspensions
                                                                                                                                                                                                                                                                                                                                                                                 .....eu mepatitis E strain SAR-55 virus - used to develop prods. for use in detection, diagnosis, vaccines and therapy of hepatitis E virus infection.

microsatellite marker sequences (MMS) at approx. 10-50 cM intervals throughout the human genome which can be detectably labelled. The MMS are polymorphic, simple sequence repeats and can be used in automated components, simple sequence repeats and can be used in automated components. The primers correspond to the unique components controlled the components of the components of the components. The primers correspond to the unique components. The MMS sequence surrounding each marker, and PCR is used to detect each components. The markers can difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. CK its comprise at least 4 groups, of at least 3 sets, each comprising care shown in AAQ55465-480 and AAQ55559-590. The chromosomal markers, published size range of the allele and degree of heterozygosity in the component for the markers covered by these primer pairs are not given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hepatitis E virus; HEV; SAR-55 strain; enteric transmission; structural region; antigen; detection; antibody; vaccine; immunisation; infection; Burma-121 strain; primer; polymerase chain reaction; PCR; ss.

                                                                                                                                                                                                            The present sequence is a hepatitis E virus (HEV) strain Burma-121 derived primer, used in the isolation of the HBV strain SAR-55 cDNA. The HBV strain SAR-55 cDNA. The HBV strain SAR-55 cDNA. The HBV strain SAR-55 was implicated in an enterically transmitted non-A, non-B hepatitis in Pakistan. The protein encoded by the structural region of the virus (i.e. ORF-2), which is capable of forming HEV like particles, is useful for the detection of HEV antibodies (pref. 199 or 199) in blood, plasma, sera, cerebrospinal fluid, tissue, urine or pleural fluid. The protein, and anti-HBV antibodies generated using the protein, can also be used in vaccines for immunising an animal against HEV infection. The protein is identified as a band of greater than 50 kb following SDS-PAGE of cell lysates of insect cells infected with a HEV ORF-2 context.
                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hepatitis E virus; HEV; SAR-55; diagnostic agent; vaccine; antibody; passive immunisation; open reading frame; ORF; PCR primer; ss.

A host organism transformed or transfected with a recombinant expression vector containing the SAR-55 nucleic acid can be used to produce the HEV proteins, especially OKF-2 protein. The recombinant HEV proteins can be used as diagnostic agents and as vaccines for use against HEV infection. The detection of antibodies specific for HEV can be used for the diagnosis of infection and diseases caused by HEV, and for monitoring the progression of such disease. Such methods are also useful for monitoring the efficacy of therapeutic agents during the course of treatment of HEV infection and disease in a mammal. The antibodies can be used for
New hepatitis E virus DNA from Pakistani strain SAR-55 - used for, e.g. developing products for diagnosis of, and vaccination against hepatitis E virus infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lee                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  11-JUN-1998

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, preventionant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove
RNA transcript of human intracellular adhesion molecule (ICAM), Eselectin or vascular cell adhesion molecule (VCAM). It can be used to inhibit expression of these proteins. Inhibition of these proteins forms the basis for treatment of conditions and diseases that have an
                                                                                  inflammatory component, e.g. acne, psoriasis, arthritis, organ rejection, wounds, burns, septic shock or inflammatory complications of septic shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumnour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a primer/probe sequence of the invention. The primer and probe sequences are derived from the sequence of the human serine protease gene LKB1, and are used to detect variations in LKB1 leading to Peutz-Jeghers (PJ) sydrome. The primers and probes can be used for the diagnosis, investigation and treatment of diseases in which variations in the LKB1 gene are implicated, such as PJ syndrome
malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
human polymorphic sites described in the method of the invention

This sequence represents a probe targeted at the ICP6 gene of herpes simplex virus type 2 (HSV-2) SB5 (ATCC VR 2546). It was used as a TagMan probe in quantiative analysis of the HSV-2 genome. The invention provides a novel genetic analysis method termed Fine Array Transcript Mapping (FAT Mapping) for detecting and measuring RNA molecules transcribed from a transcript. FAT mapping involves probing a test grid containing an array of 100s to 1000s of overlapping genomic clones or DNA fragments with probes consisting of labeled cDNAs representing the RNA transcripts from test populations. The system allows quantitative measurements of the expression of rare transcripts, and enables the analysis of 100s of genes within a genomic sequence in a single run. The method can be used to measure the differential expression of transcripts between 2 or more different viral, tissue or cell populations which share a common genomic sequence, or to determine whether a particular open reading frame is expressed under certain conditions. The FATMap technique has been applied
                                                                                                                                                                               Novel analytical method designated Fine Array Transcript Mapping, useful for detecting and measuring RNA molecules transcribed from a genome, differential expression, and sequence mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human biallelic marker downstream amplification primer SEQ ID NO:10136.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human genome, biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; SNP; PCR primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense oligonuclectides (ASO) for inhibiting a tumour necrosis factoralpha (TWF-alpha) gene in an animal, preferably a human, comprise 12-50 nucleotides, 90% of which are complementary to a region of mRNA containing a GGGA sequence motif. The ASO is used to inhibit expression of a gene in an animal and for treating the animal when afflicted with a disease or disorder characterised by the presence of an mRNA from a gene containing a GGGA motif. The ASO are specifically targeted to a GGGA sequence motif found in mRNA from a gene. A study of known ASO has shown that at least half of the most efficacious ASO's contain one or more TCC motifs. This ASO comprises a TCCC motif followed by a cytosine residue and corresponds to a region of the human ICAM-13' untranslated region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

invention, which contain a polymorphic base at position 24 of their invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA269579 to AA27744 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

                                                                                                                                                                                   AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                             pharmaccutical agents acting on a disease as well as other treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a knockout mammal for the serine/
threonine kinase gene LKBI (also known as STKII), in which all or part of
the gene or its expression regulating region is deleted. Also described
are: (1) cells which have the potential to differentiate, from the
Knockout mammal, in which expression of the intrinsic LKBI gene is
suppressed, and (2) producing the animal in which these cells are
inserted into an isolated embryo of the mammal, which is then implanted
into a false-pregnancy host female and brought to term. The knockout
cammal can be used in the investigation of the onset mechanism of
diseases in which LKBI defects are implicated, including many tumours and
Cdiseases in which LKBI defects are implicated, including many tumours
CC remedies and treatment methods for these diseases, including the
cremedies and treatment methods for these diseases, including the
cremedies and treatment methods for these diseases, including the
cremedies and treatment methods for these diseases, including the
cremedies may have LKBI suppression which is time or tissue specific.
The present sequence represents a PCR primer used in the amplification of

                                                     The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forenaics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pullmonary embolism. Single nucleotide polymorphisms (SMPS) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular disease, wenous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPB) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

The invention relates to the isolation of the sequence of the gene encoding a horse granulcoyte-macrophage colony stimulating factor (GM-CSF of AMP28953). The gene was isolated from horse lymphocytes by using a 5' and 3' RACE (rapid amplification of cDNA ends) method followed by a reverse transcriptase (RT) PCR method. The sequence shown here represents the 5' RACE primer JP730 used to isolate the 5' end of the equine GM-CSF conserved formation in various types of blood cells and particularly induces colony formation in various types of blood cells and particularly induces cytotoxicity of macrophages; stimulates antibodycopering inflammation. Vectors containing the gene or the protein itself, are useful as adjuvants in immunogenic or vaccinating compositions for horses, e.g. for protection against equine heres, teranus, Borrelia consecution adjunct example, plasmid pJP097, containing the sequence for equine GM-CSF was used to transform CHO-KI cells and the constitute medium being used to grow porcine bone marrow cells. After 14 days, the mean number of colonies per culture supernatant was then added the none for cells grown in absence of GM-CSF. Equine GM-CSF allows a colonies per culture containing component required, with none for cells grown in absence of GM-CSF. Equine GM-CSF allows a cell containing component required,

induce a response in animals that would otherwise be non-

may

Sequence 21 BP; 3 A; 6 C; 5 G; 7 T; 0 U; 0 Other;

Novel DNA encoding equine granulocyte-macrophage colony-stimulating factor, useful as adjuvant for vaccines and as non-specific immunostimulant.

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

PCR primers AAH78642-43 were used to amplify a gene fragment of the human mechanically sensitive potassium channel gene. The channel is activated by polyunasturated fatty acids (particularly arcabidonic acid (AA)) and by pilunasturated potassium channel (hTRAAK). The hTRAAK gene is located activated potassium channel (hTRAAK). The hTRAAK gene is located on chromosome 11q13. hTRAAK is involved in regulation of neuronal and muscle excitation, cardiac rhythm and secretion of hormones. Cells that express hTRAAK, designated to screen for modulators of hTRAAK activity. Such modulators are potentially useful for prevention or treatment, in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             modulators are potentially useful for prevention or treatment, in humans and animals, of: cardiac and/or vascular disease; nervous system discorders associated with ischemia and anoxia; endocrinal diseases associated with anomalous hormone secretion or muscle diseases; and retinal diseases. Typical examples are epilepsy, cardiac arrhythmia and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, mechanically sensitive potassium channel, riluzole, TWICK, polyunsaturated fatty acid, arachidonic acid, hTRAAK, chromosome 11q13, neuronal excitation; muscle excitation, cardiac rhythm; anoxia;

PCR primers AAH78639-40 were used to amplify a gene fragment of the human mechanically sensitive potassium channel gene. The channel is activated by polymosturated fatty acids (particularly archidonic acid (AA) and by polymosturated fatty acids (particularly archidonic acid (AA) and by riluzole. The polypeptide is designated human TWICK-related AA-activated potassium channel (hTRAAK). The hTRAAK gene is located on chromosome 11q13. hTRAAK is involved in regulation of neuronal and muscle excitation, cardiac rhythm and secretion of hormones. Cells that express hTRAAK, designated to screen for modulators of hTRAAK activity. Such modulators are potentially useful for prevention or treatment, in humans and animals, of: cardiac and/or vascular disease, nervous system disorders associated with ischemia and anoxia; endocrinal diseases associated with anomalous hormone secretion or muscle diseases; and retinal diseases. Typical examples are epilepsy, cardiac arrhythmia and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPB; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; ss.

primer extension (SNPE) primers, and the sequences of regions flucteoride primers and the sequences of regions flucteoride primers, and the sequences of regions flucteoride sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligomucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligomucleotides are useful for genotyping a mucleic acid sample by performing a single-nucleotide primer setusion reaction. The oligomucleotides are useful for genotyping a mucleic acid sample by performing a single-nucleotide primer setusion reaction. The oligomucleotides are useful for genotyping nucleic acid samples, for e.g. to sesses by association analysis the genotype crait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. individuals, having a pathological phenotypic traits include disease e.g. adammaglobulinamenia, diabetes insiphdus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic craits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, hervous system diseases and infection by pathogenic inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     paternity analysis.                                               encoding them. NPRI-interacting DNA is useful for modulating the level of NPRI-interacting DNA is useful for modulating the level of manipulating NPRI-interacting DNA in maize or in other plants, the plant can be engineered to improve resistance to pathogens by increasing the sensitivity or capacity of the signal transduction pathway. The plants containing altered NPRI expression are useful as universal disease susceptible plants. NPRI-interacting DNA is further useful for sequence shuffling. They are also used as probes. The invention also provides transgenic plants with increased disease resistance. The present sequence is an internal primer used to identify proteins that interact with NPRI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nucleic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebola), cancer and immune system disorders. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                   invention relates to NPR1-interacting proteins and nucleic acids
                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Selenoprotein; HIV; Ebola virus; cancer; immune system disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New selenoprotein for use in detecting certain viruses, e.g. human immunodeficiency virus (HIV) or Ebola, cancer and immune system
                                                                                                                                                                                                                                                                                                                      0

The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nucleic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Bbola), cancer and immune system disorders. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Selenoprotein; HIV; Ebola virus; cancer; immune system disorder; ss.
                                                                                                                                                                                        New selenoprotein for use in detecting certain viruses, e.g. human immunodeficiency virus (HIV) or Ebola, cancer and immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New selenoprotein for use in detecting certain viruses, e.g. human immunodeficiency virus (HIV) or Ebola, cancer and immune system

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a mucleic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebola), cancer and immune system disorders. The present sequence was used to illustrate the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                      ö
The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nucleic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebola), cancer and immune system disorders. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a mucleic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebola), cancer and immune system disorders. The present sequence was used to illustrate the invention. (Updated on 07-MOG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a method for assessing the risk of prostate cancer in a human subject. The method involves determining the length of the contiguous CAG or CAA repeats in both AIBI (Amplified In Breast cancer 1) gene alleles or contiguous CAG, CAA or GGN repeats in the androgen receptor gene of the subject. The method is useful for assessing a subject's risk for acquiring or developing prostate cancer. The present sequence is a DNA encoding human androgen receptor (AR) polyglycine tract. This sequence is used in the molecular analysis and assessment of the CAG and GGN repeat of AR gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Assessing the risk of acquiring or developing prostate cancer in a human subject, comprises determining the length of the contiguous CAG, CAA and/or GGN repeats in the AIB1 gene and/or androgen receptor gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to a recombinant dimethyl sulphide (DMS):acceptor oxidoreductase (I) or its subunit selected from recombinant alpha, beta, delta and gamma subunits. (I) is useful for oxidising prochiral organic sulphides to form sulphoxide enantiomers for chiral drug synthesis. (I) is expressed in a transformed bacterium. The enantiomer formed is useful for producing a chiral drug. (I) is useful for synthesis of optically-active functional groups of drug. DNA encoding (I) is useful for producing a strain of DMS:acceptor oxidoreductase- deficient Rhodovulum oxidoreductase activity is unwanted. ABKG3751-ABK53805 represent R. sulfidophilum DMS:acceptor oxidoreductase subunit coding sequences and
                                                                                                                                                                                                  New recombinant dimethyl sulfide:acceptor oxidoreductase or its subunits, useful for oxidizing prochiral organic sulfides to form sulfoxide enantiomers for chiral drug synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumour necrosis factor receptor 2; TNFR2; antisense oligonucleotide;

                                                                                             to a nucleic acid encoding human or mouse tumour necrosis factor receptor 2 (TWFR2). Also described is a method for inhibiting expression of human or mouse TWR2 comprising contacting cells or tissues in vitro with one of the claimed compounds. The antisense compounds are used to treat a disease or condition associated with expression of TWFR2. The present sequence represents a PCR primer for human TWFR2, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, NOVX; atherosclerosis; hypertension; obesity; cancer; cytostatic; hypotensive; antiarteriosclerotic; anorectic; gene therapy; NOV68; PCR;

The proteins and coding sequences are useful for preventing or treating disorders or syndromes e.g. atherosclerosis, hypertension, obesity or cancer. The present sequence was used in an example from the

The invention relates to a method for determining the susceptibility of an individual to inflammatory bowel disease. The method comprises screening the genetic material of the individual to determine which allele of the TNF (tumour necrosis factor) -857c/T polymorphism is present. The invention also relates to a method of determining the susceptibility to, or confirming the diagnosis of, Crohn's disease in a causasian individual comprising screening the genetic material of the subject for the presence of the TNF -1031C/-863C/-857C/-308G haplotype. The invention additionally encompasses gene therapy for Crohn's disease in a causasian with the -1031C/-863C/-857C/-308G haplotype. Cromprision of genetic material comprising the TNF production of genetic material comprising the TNF production for the invention further discloses methods for preventing TNF production for the treatment of inflammatory bowel disease. Inflammatory bowel disease. The invention is bases on the disease of the bowel gastrointestinal tract, and can exist as either ulcerative colitis, or as Crohn's disease. The invention is bases on the disease of the bowel gastrointestinal tract, and can exist as either ulcerative colitis, or as Crohn's disease. The invention is bases on the disease of the bowel gastrointestinal tract, and can exist as either ulcerative colitis, or as Crohn's disease. The invention involve additional determination of these NoD2 che invention involve additional determination of these NoD2 che invention involve additional determination of these NoD2 clauses of the invention subject to inflammatory bowel disease, such as ulcerative colitis of a Crohn's disease. The methods are also useful for confirming the diagnosis of a Crobn's disease. The methods are also useful for confirming the diagnosis of a clausasian subject as having crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       determining the response of a patient to treatment. The agents and the genetic material, comprising TNF -1031T, -863T, -857T and/or -308A alleles, or TNF -1031T/-663T/-857T-308A haplotype, are useful in manufacturing a medicament for preventing or treating Crohn's disease in a Caucasian subject. Sequences ADB92791-ADB92792 represent the top and bottom strands of a consensus OCT1 binding site EMSA (electrophoretic mobility shift assay) probe used in the example of the invention. OCT1 is
Determining the susceptibility of a Caucasian subject to inflammatory bowel disease such as Crohn's disease, comprises screening the genetic material of the subject to determine which allele of the TNF -857C/T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

ERKs are also referred to as mitogen activated protein (MAP) kinases. The hybridoma that produces the monoclonal antibody is also claimed. The antibody is useful for preparing a composition for treating hERK-5-associated diseases e.g. diabetes mellitus, Alzheimer's disease or peripheral neuropathies in a mammal. The polymucleotide encoding the protein is also useful for treating these diseases using gene therapy rechniques. The sequence presented is an oligonucleotide probe, version #2, which corresponds to a region of the rat ERK-3 coding sequence, and was used designed as a 32 fold degenerate sequence from ERK1, ERK2 and
                                                                                                                                                                                                                                                                                                                                                                                            New antibody, useful for preparing a composition for treating extracellular signal regulated kinase - 5-associated diseases in a mammal e.g., diabetes mellitus, Alzheimer's disease or peripheral neuropathies.

The reactions between molecular rargets and probe molecules compilisation which probe molecules are immobilised in predetermined regions. The base intoludes an opening for receiving the carrier and is optically cranical molecules are immobilised in predetermined regions. The base intoludes an opening for receiving the carrier and is optically controlly an opening for receiving the carrier is made of glass and/or silicon and the vessel is made of glass (optionally controlly proteins) and the plastics, glass ceramic, plastics or metal. Probes are controlly proteins (e.g. antibodies, peptides and/or hormones) or muclaic acids (DNA and/or RNA). The detection system is a camera, especially a charge-coupled device or CMOS camera, optionally fitted with an optical read-out system. The device may include a light source that ensures homogeneous controlled a light sources are lasers, LED, plane system. The device may include a light sources are lasers, LED, plane system. The device may include a light sources are lasers, LED, plane sources that are superimposed. These sources are lasers, LED, plane sources that are superimposed. These sources are lasers, LED, plane control unit and optionally a filter exchanger, a structured to ensure homogeneous illumination. The system preferably also contains optical filters and optionally a filter exchanger, a semperature control unit and a computer that collects signal intensities from the detector and converts them to an analogue image. The reaction contains on the probes and any interaction detected, e.g. from conventional labels are contacted with probes and the time progression of precipitation is detected as a signal intensity. Particularly a soluble precupitation is detected as a signal intensity progression of precipitation is detected as a signal intensity progression of precipitation is detected as a signal intensity progression of precipitation of a silver salt (nitrate, perparation may occur in the presence of a metal especially and probes and the precipitate. The new res
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                a device for performing microarray tests, i.e. interaction of a target with protein, peptide or nucleic acid probes, e.g. for biomedical, including hybridisation or immunological, tests. The reaction vessel is of simple construction, is easy and inexpensive to make and is compatible with other laboratory apparatus (e.g. bench centrifuges and pipettes). Micro-array tests can be performed in a single vessel, reducing the risk of contamination and only relatively simple detectors are required. ADJ99048-ADJ99087 represent probes used to detect the cyp206 gene which encodes human cytochrome-P450 and are used to illustrate the method of
interactions between molecular targets and probe molecules comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           probe; ss; chemical modification; methylation; array; CpG island; tumour suppressor; pl6; human; H69; H1618.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human DNA probe used to immobilise CpG methylated DNA SeqID 164.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                            Human KIAA0172 gene encoding a sequence of 1194 amino acids, useful for diagnosis and treatment of cancer and for development of effective growth inhibitors of cancer cells.
                                                                                                                                                                                                                                                                                                                                                      The invention relates to new human KIAA0172 gene. The KIAA0172 gene and polypeptide are useful for detection and treatment of cancer. The present sequence represents KIAA0172 associated primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reaction vessel, useful for detecting a specific interaction between a target and probe, e.g. in medical tests, comprises at its base a carrier for immobilized probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel reaction vessel for detecting specific

This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In
                                                                                                                                                                                                                     Analysis of chemical modification of DNA involves obtaining sample of DNA to be analyzed, treating DNA with chemical reagents that result in different base sequences, and determining sequence of resulting DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pi6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the

This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the Analysis of chemical modification of DNA involves obtaining sample of DNA to be analyzed, treating DNA with chemical reagents that result in different base sequences, and determining sequence of resulting DNA. Analysis of chemical modification of DNA involves obtaining sample of DNA to be analyzed, treating DNA with chemical reagents that result in different base sequences, and determining sequence of resulting DNA.                                                                                                                                                                                                                                                                                                                                                                            ;
                                          medified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pic from two human lung tumour cell lines HéS and Hills. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        modified macromolecules. Specifically, it refers to siRNAs that target and cause RNAi-induced degradation of mRNA from human vascular endothelial growth factor (VEGF), the VEGF receptor (Flt-1) and the Flk-1/KDR (kinase domain region) genes, as well as mutants derived thereof. The present invention describes sense and antisense RNA strands that form an RNA duplex and bind to the target mRNA, such that expression is inhibited and the target degraded. As such, siRNA administered in combination with a therapeutic agent is useful for treading diseases associated with angiogenesis and the overexpression of VEGF, which include diabetic retinopathy, agenelated macular degeneration, inflammatory disease, psoriasis and
probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the

                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to the method for making an artificial neural network embodied on a computer-readable medium for predicting antisense activity of oligonucleotides for down-regulating expression of a selected RNA. The invention provides a five-fold reduction in the number of oligonucleotides to be screened in vivo to find effective targets. The present sequence is human ICAM-specific antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Predicting antisense activity of an oligonuclectide for down-regulating expression of an RNA, comprises developing an artificial neural network, determining counts of mapped sequence motifs, and obtaining a output of
                                              DNA
         cancers including breast, retinoblastoma, Wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antidiflammatory, antipsoriatic, antirheumatic and antiarthritic activities. This oligonucleotide is a human Flk-1/KDR oligo, a target for siRNA inhibition of the invention.

that contacts tissue and/or liquids of the human or animal body and is at least partly coated with a substance that mediates binding of biological materials. The new feature is that this substance is an aptamer. The device is particularly an implant, e.g. a stent, vascular prosthesis, heart valve, joint etc., but may also be a component of an extracorporeal circulation system, a nanomaterial for tissue engineering and vascular surgery, a catheter, contact lens, storage device for blood etc., also a bioreactor for isolation and culture of selected cell types, for production of substances or for growing organ replacements. The present sequence is an aptamer suitable for use in the device of the invention.
                                                                                                                                                                    Device with substance to aid adhesion of biological material aptamer #4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Device with substance to aid adhesion of biological material aptamer #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a device that has at least one surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Device coated with aptamers for binding specific biological materials, useful e.g. as stent or component of extracorporeal circulation system, also new aptamers specific for endothelial precursor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The sequences given in AAQ41767-825 represent sequences which are bound in an electrophoretic mobility shift assay (EMSA) by Myc. The isolated sequences contain the central E box core of CACGTG which binds very weakly with Myc homo-oligomers (CI complex), but more tightly with Myc hetero-oligomers (C2 complex). The C2 complex requires a 26-29 kD factor in addition to Myc. The additional factor copurifies with Myc and resembles Max protein. A second copurifying 40-50 kD factor has been identified (forming C2 complex). Sites selected by the C2' complex contain the core CAGCTG which bears remarkable homology to a myogenin binding site (see AAQ41763). Oligonucleotides containing the E box can bused in the purification of Myc from a mammalian source. See also AAQ41761-861. The isolated trarget sequences may be used in a method to himbiat c-Myc oncoprotein activity. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying the nucleotide at specific position in a target sequence for detecting disease-related point mutations involves extending a primer that binds adjacent to the specific site to incorporate a labeled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for determining the identity of
                                        Prodn. of c-Myc protein from mammalian cells - and detection of c Myc inhibitors for use in cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection; primer extension; point mutation; pathogenicity; therapy; cancer; genetic disease; polymorphism; apolipoprotein E; ApoE; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                        The present invention relates to a device that has at least one surface that contacts tissue and/or liquids of the human or animal body and is at least partly coated with a substance that mediates binding of biological materials. The new feature is that this substance is an apcamer. The heart valve, joint etc., but may also be a component of an extracorporeal circulation system, a nanomaterial for tissue engineering and vascular surgery, a catheter, contact lens, storage device for blood etc., also a ploreactor for isolation and culture of selected cell types, for production of substances or for growing organ replacements. The present sequence is an aptamer suitable for use in the device of the invention.
                                                                                                                                                                           Device coated with aptamers for binding specific biological materials, useful e.g. as stent or component of extracorporeal circulation system, also new aptamers specific for endothelial precursor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

specific nucleotide at one or more defined sites in a target nucleic acid polymer involves formation of a detectable primer extension product if the specific nucleotide is present at the defined site in the target nucleic acid. The method is specifically used to detect point mutations which are associated with altered pathogenicity or resistance to therapy of a microrographism, particularly human immune deficiency virus or with cancer or a genetic disease (or susceptibility to it) in humans, but more generally can be used to detect mutations in RNA or DNA from animals, plants or microorganisms. By selecting a primer that binds adjacent to the specific site, variations at this site can be detected following incorporation of only a single dNTP. The method requires only a few, comporation of the proportion of mutated calls in a mixed population, down to 0.5% of this population. The method is easily automated. This sequence represents a PCR primer used to detect a polymorphism in human
                                                                                                                                                                                                                                                                                                                                                                                                                .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defined primer sets, useful for subtyping or typing of HLA Class I alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HIA)-A, HIA-B, or HIA-C alleles. The method is useful for subtyping of typing of HIA, class 1 alleles. The present sequence is an amplification primer used in the method
endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutant organisms referred to as GRACE strains of the organism. The invention can be applied to any organism, particularly a pathogenic fungus e.g. Candida albicans, Aspergillus fumigatus and Cryptococcus neoformans. The methods are useful to identify agents that may be used in the treatment of fungal infections, AAS23687-AAS23147 represent primers A #1-61 used as probes

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (TRNRP2), bradykinin receptor B1 (TRNRP2), cleaterase inhibitor (CINH), kallikrein tachykinin receptor B1 (TACR1), Cleaterase inhibitor (CINH), kallikrein (CC (CC)), bradykinin receptor B2 (TACR2), cn protesse inhibitor 4 (FT4), comprising at least one polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional s and 3' flanking genomic sequence; (2) analysing (M1) at least one nucleic acid sample comprising control of analysing (M3) an individual at risk of developing a brotein selected from the group above; (3) constructing (M2) and individual at risk of developing a disorder using the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a protein selected from the group above; and (6) genotyping (M4) and individual comprising obtaining a nucleic acids, each of which individual comprising obtaining a mucleic acids, each of which individual comprising obtaining a mucleic acids and (6) genotyping (M4) and individual comprising obtaining and score acid sample, determining the mucleotide present in at least one polymorphic position, and comparing at least one polymorphic position, and comparing and compositions are useful for detecting, dispenses, (M1, M2, M3 and M4) and compositions are useful for detecting, dispenses which involve angiogenesis like haemangiomas, tumours, sarcomas, Crobu's or preventing various disorders such as angiocedaema and diseases which involve angiogenesis like haemangiomas, tumours, sarcomas, Crobu's and hyperreophy vascular dissease, anteriosclarosis, and composition, vanet, wo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polymuclectides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is a genotyping PCR primer for the gene encoding one of the proteins listed above, using the method of automated genetic bit analysis, GBA

Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.

Claim 36; SEQ ID NO 4011; 167pp + Sequence Listing; English.

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a fuploid fungus or and for identifying a therapeutic agent for treatment of a mammalian agent, an antifungal agent that inhibits the growth of a diploid fungus compound values to the virulence, preferably ensymatic activity, carbon catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of c. albicans cells and for translating infection by C. albicans. New NOVX or NOV1 polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders e.g. cardiomyopathy, atherosclerosis, cancer, Huntington's disease or Alzheimer's disease.

Example 2; Page 96; 124pp; English.

The present invention describes human NOV1 (an endozepine-related protein precursor-like protein). Human NOV1 maps to human chromosome 10. NOV1 has evtostatic, antiatrefroscalerotic, antidabetic, haemostatic, anti-HIV, antiatrefroscalerotic, antidabetic, haemostatic, anti-HIV, antiatrefroscaleroty, hypotensive, neuroprotective, anciental antidepressant, immunosuppressive, tranquilliser, analgesic, cardiant, gastrointestinal, anticonvulsant, immunomodulator, antialcoholic and antilipaemic activities, and can be used in gene therapy. NOVX nucleic acids, polypeptides and antibodies are useful for treating or diagnosing diseases such as cancers, Von Hippel-Lindau syndrome, Alzhaimer's disease, stroke, tuberous sclerosis, Parkinson's disease, hypercalcaemia, Huntington's disease, cerebral palsy, epilepsy, lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangictasia, pain, leukodystrophies, behavioural disorders, addiction, anxiety, depression,

                                                                                                                            ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is an antisense primer for cytochrome P450 CYP27A1.

The PCR was used to characterise metabolic enzyme induction by vitamin D malogues, corticosteroids and macrolactams in human skin. The invention provides for the use of antagonists of P450 enzymes for the prevention or alleviation of a tachyphylactic response to administration of a vitamin D analogue, corticosteroid or macrolactam to a patient, e.g. for the reatment of psoriaais. The underlying cause of tachyphylaxis was shown or receptor down-regulation. Exposure of a patient to the drug for extended periods results in an increase in the expression of enzymes which are capable of metabolizing the drug. A method for treatment of tachyphylaxis therefore involves inhibiting the induced metabolic enzyme. Sepecially a P450 cytochrome, by administration of an antagonist of the enzyme. Detection of an increase in the amount and/or activity of a metabolic enzyme capable of metabolizing a drug following extended exposure of a cell from an individual to the drug indicates the increased likelihood of that individual developing a tachyphylactic response to the
                                                                                                                                                                                                      ö
neurodegenerative disorders, stress, immune disorders, alcoholism, obesity, diabetes, haematopoietic disorders, dysliptdaemias, and wasting disorders associated with chronic diseases. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell proliferation, etch differentiation, haematopoissis, wound healing and angiogenesis. The present sequence represents a PGR primer for human NOVI, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alleviating or preventing a tachyphylactic response to an agent and treating psoriasis, comprises administering an antagonist of a metabolic enzyme, which is induced as a result of exposure to the agent, to a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises the amino acid and coding sequences of two novel Bacillus sp acid proteases. The novel acid proteases of the invention are useful as digestive enzymes for the hydrolysis of proteins in drugs and foods. The present DNA sequence represents a PCR primer that is specific for the gene sequence of a Bacillus sp acid protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A new acid protease in which the serine residue participates to activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Acid protease; PCR; primer; ss; digestive enzyme; protein hydrolysis;

                                                                                                                                                                                                         The invention comprises the amino acid and coding sequences of human NOVOX (NOV1 and NOV2) proteins. The NOVOX proteins of the invention are useful for identifying an agent (a cellular receptor or downstream effector) that binds to a NOVOX protein. The NOVOX DNA and protein sequences of the invention are useful for the treatment (gene therapy) opervention (vaccine) of: cancer, neurodegenerative disorders; immune disorders; haematopoietic disorders; dyslipidaemia, obesity; metabolic syndrome X; wasting disorders; von Hippel-Lindau (VHL) syndrome;
                                                                                             Novel cytoplasmic, nuclear, membrane bound and secreted NOVX polypeptides, useful for treating cancers, neurodegenerative disorders, immune disorders, hematopoietic disorders, diabetes and metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Macdougall JR, Millet I, Ellerman K, Stone DJ;
